TOP
Use the configuration file path button to view the list of .ini files. Choose a single file and select OK.
After choosing a configuration file use the soft trigger button to configure a soft trigger unless you want to use an external trigger with your UUT.

Press the “run vi” button in the top left of the screen and the graph and status monitor will be ready to display data as shown above.

This vi requires a special ini file that contains the file paths of the ini files that correspond to the UUTs you want to use. It is necessary to create your own version of this file as the file paths are absolute, not relative to the project. The easiest way to configure this would be to copy and paste the ini file highlighted here and change the content to your own paths and UUTs.
File name: Multi UUTs (1014).ini

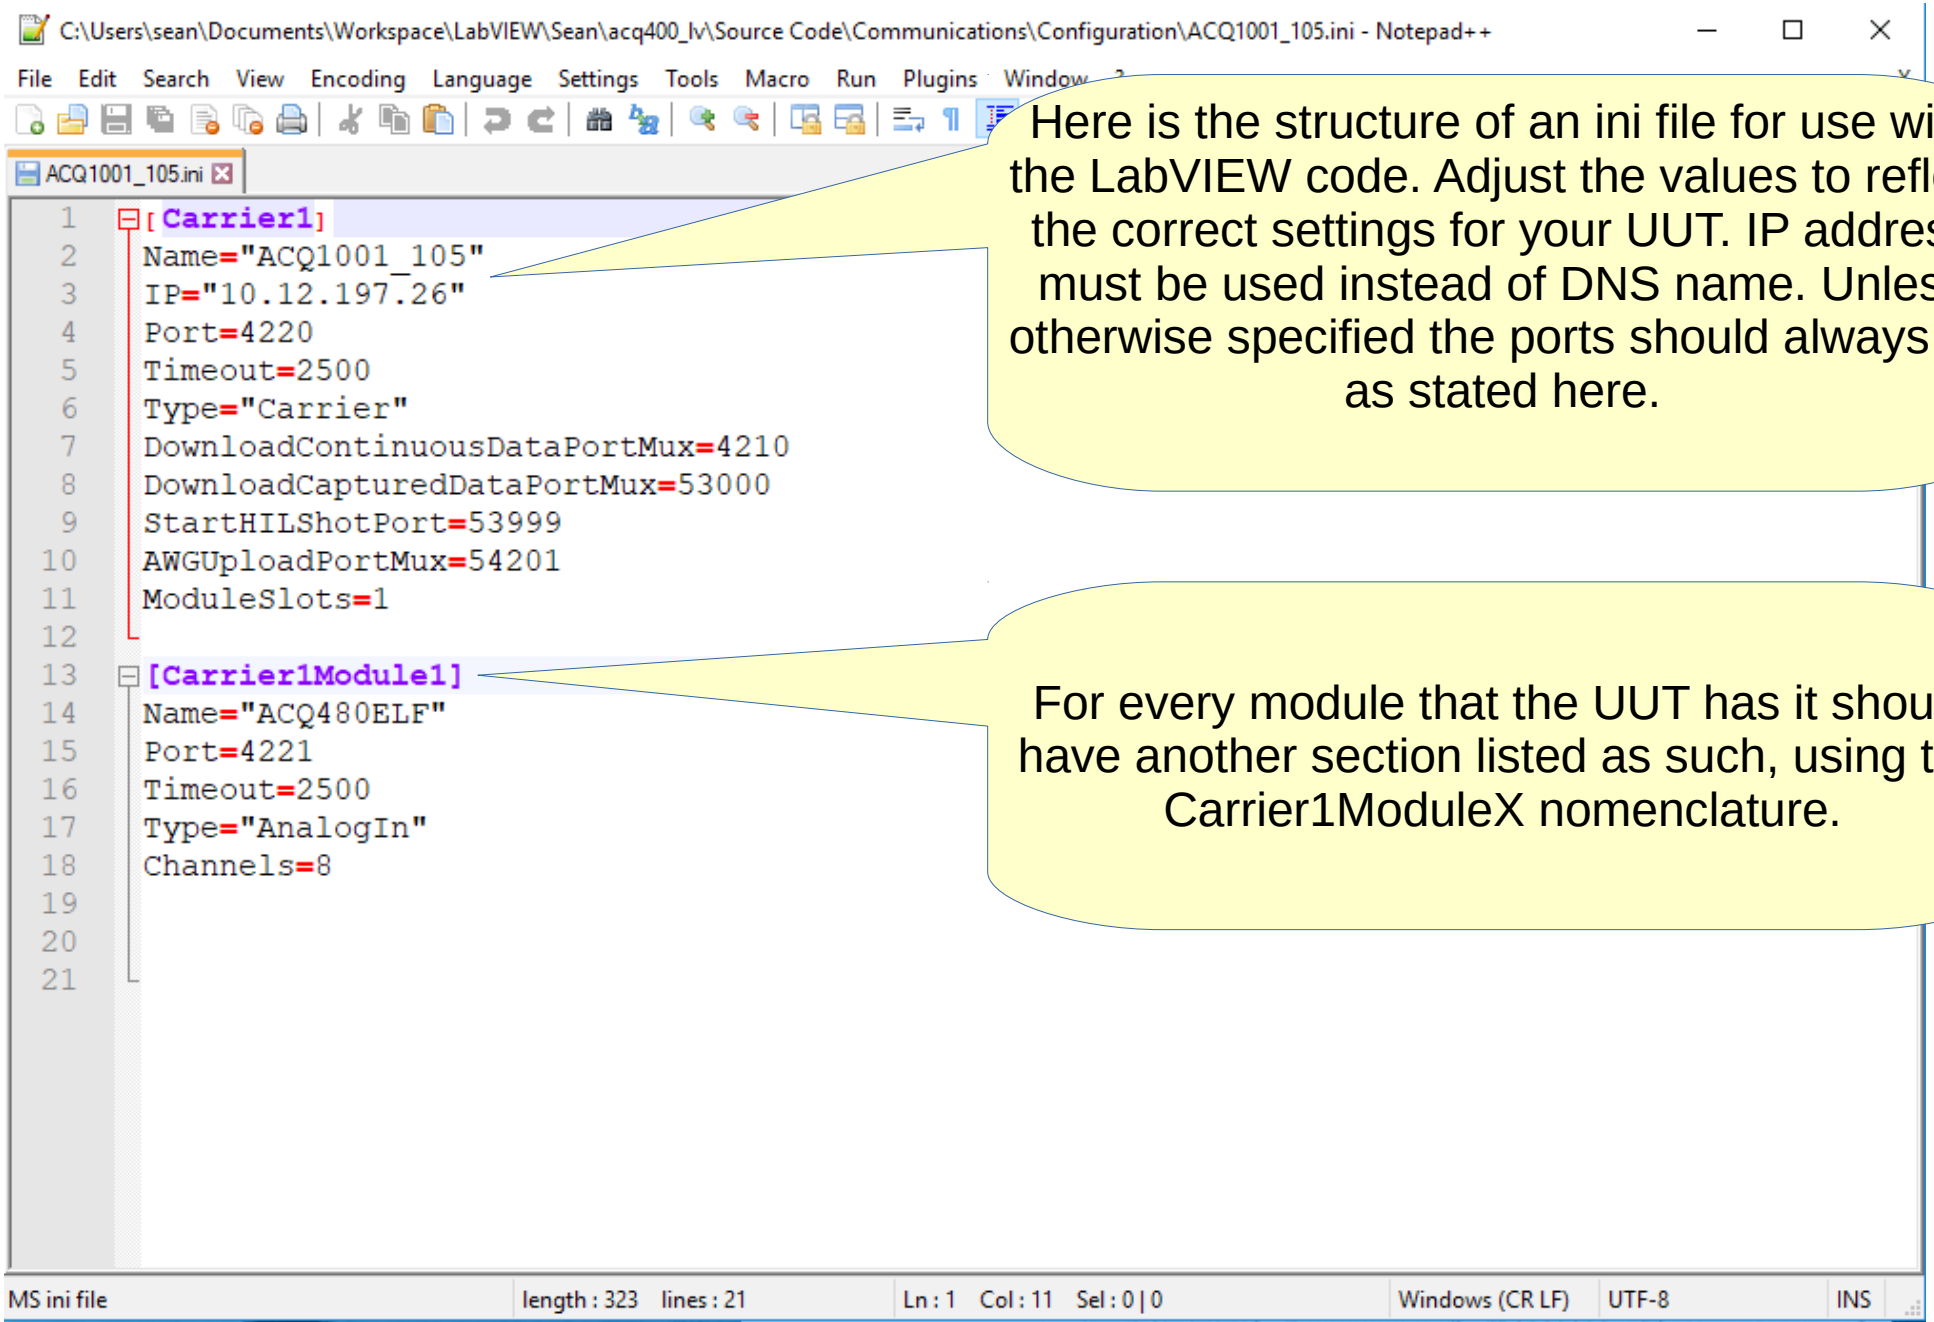
LabVIEW Guide – ini files

Ini files available from: acq400_lv\Source Code\Communications\Configuration



Here is the structure of an ini file for use with the LabVIEW code. Adjust the values to reflect the correct settings for your UUT. IP address must be used instead of DNS name. Unless otherwise specified the ports should always be as stated here.

For every module that the UUT has it should have another section listed as such, using the Carrier1ModuleX nomenclature.
